

Biodiversity and non-deforestation policies of Dynamic

Biodiversity is the foundation for a stable ecosystem and is crucial to the earth's resilience and to the coexistence of humans and nature.

Dynamic has recognized the importance of biodiversity and non-deforestation to the stability of the ecological system, and will actively put efforts in biodiversity affairs to achieve non-deforestation standards at all operating sites by 2030, moving towards a net positive impact on biodiversity.

We are committed to the followings:

1. Not conducting operations in biodiversity hotspots and ecologically adjacent areas listed globally or in each country to avoid negative impacts on protected species.
2. If biodiversity hotspots are affected around existing operating sites, mitigation, restoration and compensation solutions will be proposed.
3. New factories should be built with construction engineering methods that mitigate environmental impact and consider green building design.
4. Ensuring that new development projects comply with environmentally friendly design while being economically cost-effective.
5. Forest restoration compensation will be provided for the amount of paper, packaging, building materials and other forest trees consumed in operational activities.
6. Continuing to enhance awareness of the importance of biodiversity and forest conservation in the value chain. Plan to join hands with our suppliers and partners to abide by non-deforestation commitments, and act together to achieve the vision of the United Nations Biological Diversity Convention.
7. Regularly disclose the implementation results of biodiversity and non-deforestation promotion on the official website or sustainability report.
